Intended Audience

The intended audience of this document is the technical developers/implementers of the NCR Voyix Incident Management Integration Service. The intended purpose is to detail the data objects passed over the internet and the operations exposed for both Inbound NCR Voyix Web service and Outbound Customer hosted Web service to facilitate the bi-directional communication required to establish a successful integration.

Integration Support

All vendors using NCR Voyix Integration services are required to have 24x7 support procedures documented and accepted by the NCR Voyix Service Desk. NCR Voyix support for Integration services is available 24 x7 by contacting the NCR Voyix Service Desk. Procedures on contacting NCR Voyix for support will be provided separately.

Endpoint Versions

NCR Voyix will provide RESTful capable endpoints via the Enterprise Service Bus implementation. Endpoints for development/QA and production environments will be provided at the appropriate stages during the development cycle.

NCR Voyix Standard Inbound & Outbound payload formats

NCR Voyix technical team will provide inbound and outbound payload formats will be provided at the appropriate stages during the development cycle.

Security / Authentication and Authorization

NCR Voyix supports connectivity over internet or VPN with following security requirement to implement the web service communication both ways:

2 Factor Mutual authentication

NCR Voyix standard is 2 Factor Mutual authentication that includes:

- ✓ Customer/vendor needs to send the credentials in WS-security SOAP header to NCR Voyix
- ✓ Customer/vendor needs to generate the client certificate for the server from which NCR Voyix service will be invoked (HTTPS URL). The certificate must be from one of the trusted global CA's (Symantec/GoDaddy/Thawte/Comodo/GeoTrust)

Note: If the customer/vendor cannot meet NCR Voyix standard requirement for 2 factor mutual authentication, NCR Voyix will need to obtain an internal security exception. Obtaining an exception will add time to the overall timelines for the interface implementation.

Additional information on Two Factor authentication (Can use any form of dual authentication - Client cert /Hard Token). Also the request should be digitally signed to minimize tampering.

1. SSL Mutual Authentication Certificate Requirements:

- ✓ Commercial certificates, issued by a trusted global provider ONLY from the following list: Symantec, GoDaddy, Thawte, Comodo, GeoTrust
- ✓ URL must be HTTPS and make use of commercial certificate as mentioned above
- ✓ Multi-tenant can use one Server certificate
- ✓ CN name in the certificate should include and match the customer name
- ✓ Certificate must not be expired
- ✓ Certificate must not be revoked. If CRL unreachable then use OCSP

Note: Separate certificates are required for Test and Production environments (NCR Voyix does NOT recommend using same certificate for both the environments)

2. NCA/SOUP Account:

- ✓ Unique ID per business process
- ✓ Unique ID per indirect customer (customer's customer)
- ✓ For each Web Service
 - Password minimum 24-character long
 - Manual password to change annually to coincide with the SSL certificate renewal.

NCR Voyix Environment	Security Mechanism	URL
CERT	2 Factor Mutual Authentication (Client Certificate)	Specific URL will be provided with the login and password information
	2 Factor Mutual Authentication (Client Certificate) over VPN	Specific URL will be provided with the login and password information, if applicable

PROD	2 Factor Mutual Authentication (Client Certificate)	Specific URL will be provided with the login and password information
	2 Factor Mutual Authentication (Client Certificate) over VPN	Specific URL will be provided with the login and password information, if applicable

NOTE: Generic Web Service operational information has been provided in this document. Customer specific mapping (elements, values, required/optional) will be finalized in a separate mapping session to create a mapping document with NCR Onboarding team.

Character Restrictions

N.A.

NCR Voyix Inbound- Supported Operations

1. CreateRequest

This operation allows customers to create Incident in NCR Voyix Incident Management system. Refer to 'CreateRequest-ToNCR Voyix' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of fields and field specific information.

CreateResponse

This operation is a synchronous response message from NCR Voyix systems to customer systems in response to the CreateRequest sent.

Refer to 'CreateResponse' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of fields and field specific information.

2. UpdateRequest

This operation allows customers to add remarks on existing ticket.

Refer to 'UpdateRequest-ToNCRVoyix' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of fields and field specific information.

UpdateResponse

This operation is asynchronous response message from NCR Voyix systems to customer systems in response to the UpdateRequest sent.

Refer to 'UpdateRequestACK-FromNCRVoyix' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of fields and field specific information.

3. ResolveRequest

This operation allows customers to Resolve the ticket already created. The ticket should be assigned to Customer Queue for Resolve operation to work correctly.

Refer to 'ResolveRequest-ToNCRVoyix' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of fields and field specific information.

NCR Voyix Outbound

Customer hosted Web service which is to expose below operations for NCR Voyix to publish Unsolicited and Solicited updates to customer.

IncidentUpdate

This operation should be used by the customer to accept both Solicited and Unsolicited Updates back from NCR Voyix.

Refer to 'IncidentUpdate-FromNCRVoyix' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of fields and field specific information in this web service.

IncidentUpdateResponse

This operation should be used by the customer to send the response immediately back to NCR after receiving the IncidentUpdate message.

Refer to 'IncidentUpdateResp-ToNCRVoyix' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of fields and field specific information in this web service.

NCR Voyix Outbound 2-Way

IncidentUpdate (2-Way)

This operation should be used by the customer to accept Create Request from NCR Voyix when ticket is created by Service Desk manually in NCR system.

The payload format is same as NCR Voyix Outbound but in this case NCR Voyix will be sending Customer Ticket # as NULL so that it can be created in Customer system and will be updated later in NCR Voyix system.

Refer to 'IncidentCreate-FromNCRVoyix' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of fields and field specific information in this web service.

Faults/Error Handling

From NCR Voyix interface perspective, following types of errors would be expected:

1. **Business Faults:** These are the ones returned from NCR dispatch systems. These would be propagated back by the Web service interface to the calling application/customer.
2. **Technical Faults:** These are the faults caused due to system errors, either at the middleware layer or with connectivity with the backend dispatch system. These errors would be sent back to the caller/customer.

In addition to error handling, NCR Voyix web standard follows these steps in case of system failures.

- NCR Voyix web service will retry on system failures of both NCR and Customer side
- NCR Voyix Account team is notified via email of NCR system failures (Optional)
- Customer tickets will be updated with the NCR system exceptions

Refer to 'ErrorMessages' worksheet in separately provided 'NCR Voyix Restaurant Standard Data Mapping' document for the list of Error codes and descriptions.
